

SnapIMS Operator Guide

Version 0.6.0
Photo-first inventory workstation

Purpose

SnapIMS converts chronologically captured photos and QR events into durable inventory records, AI suggestions, a fast Review queue, a bulk Batch Editor, CSV round trips, and publish-ready outputs.

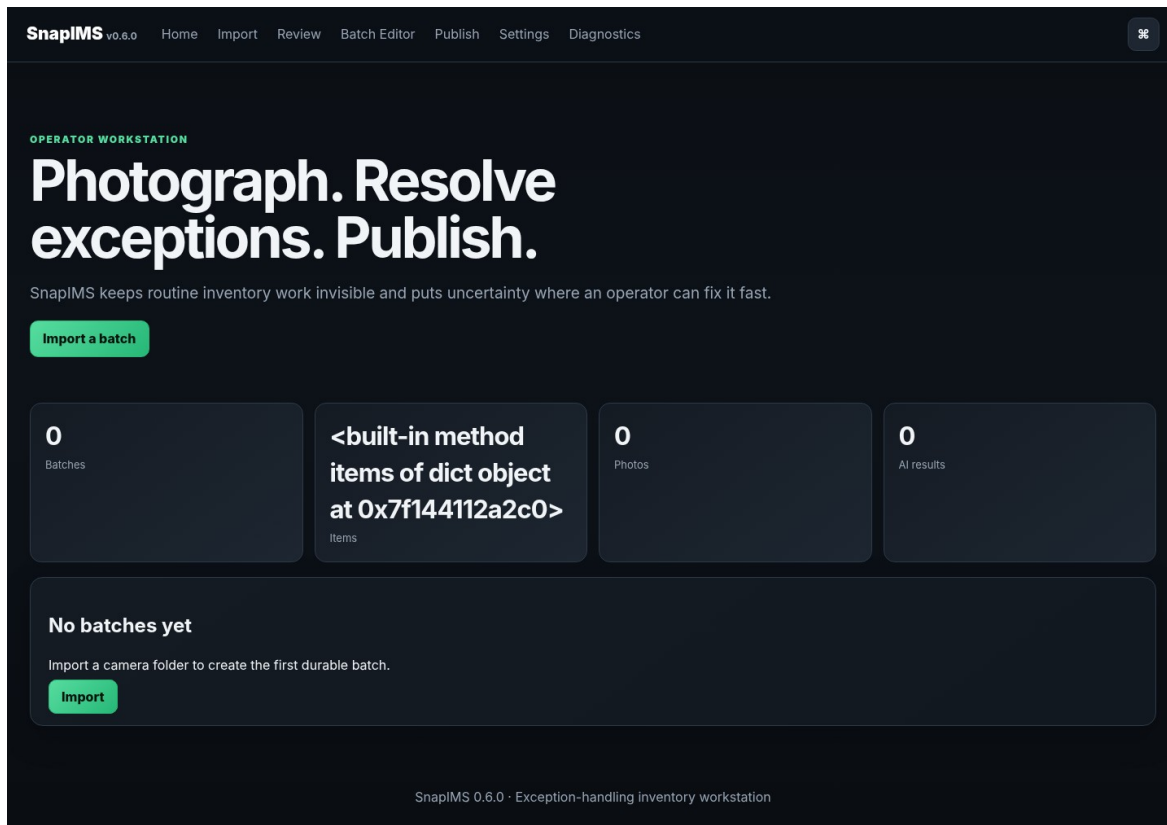

Routine operator path

1. Photograph tapes with SnapIMS QR cards.
2. Import and preview the folder.
3. Run recognition or continue manually.
4. Review one tape at a time or use Batch Editor.
5. Validate, simulate, export CSV, or publish.

Launch command

`cd ~/Projects/SnapIMS-v0.6.0 && source .venv/bin/activate && snapims --data-dir ~/SnapIMS-data serve`

Open <http://127.0.0.1:8767>. Leave the terminal running. Ctrl+C stops SnapIMS.

Home dashboard and batch health summary

1. Import a photo batch

Open Import. Normal operation uses Browse Folder, the configured incoming folder, or a recent folder. Manual path entry is under Advanced.

A blank Use This Folder action is disabled. Invalid or unreadable folders return a normal SnapIMS message instead of raw API JSON.

IMPORT

Import new batch

Browse to a camera folder, verify QR grouping, then preserve one durable batch.

CURRENT SOURCE /mnt/data/SnapIMS_dev/operator-audit-assets/v0.6.0-browser/workspace/incoming

Browse Folder...

Optional batch name

HORROR

Import preview before durable preservation

Choose Preserve and Import Batch once the preview is correct. SnapIMS prevents duplicate commits and preserves originals before creating working records.

Durable batch created after preservation

2. Recognition and failure recovery

Run recognition from Review. Provider status is visible. If OpenAI is selected without a key, SnapIMS shows an actionable recovery view instead of silently refreshing.

Available recovery actions include Retry, Retry Failed Items Only, Retry With Different Provider, Continue With Manual Review, Skip Recognition, Open Diagnostics, and Return to Import.

SnaplMS 0.6.0 · Exception-handling inventory workstation

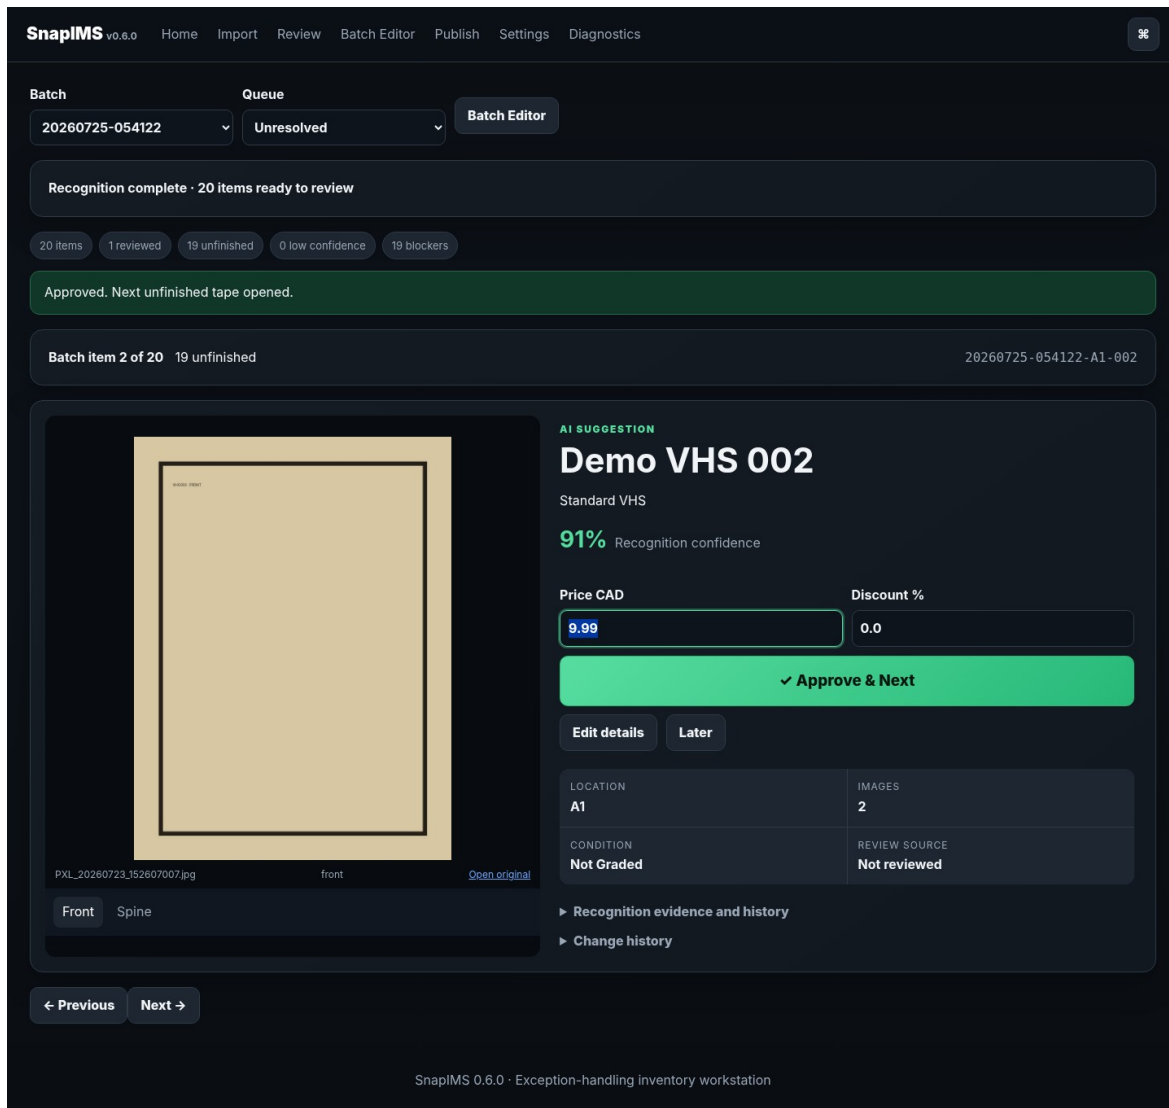

Completed recognition ready for operator review

3. Fast Review workstation

Routine workflow: inspect the photo, confirm the title, optionally type a price or discount, then approve. Edit mode is for exceptions only.

The Price field opens focused with its current value selected. Type a replacement price and press Enter. SnapIMS saves the working values, approves the tape, opens the next unfinished tape, and focuses the next Price field.

When the shown AI title is valid, Approve & Next accepts it. A truly blank title opens manual editing with a clear explanation.

Price -> Enter -> next tape keyboard workflow

Later leaves the tape unfinished. Completed items can be reopened and corrected without changing their immutable Item ID.

4. Batch Editor

Batch Editor is the fast bulk-work workstation. Title, price, discount, description, location, flags, confidence, and status remain visible without horizontal scrolling at the standard workstation size.

Use filters for unresolved, failed, low confidence, missing title, CSV changes, price thresholds, flags, and recent edits. Sort by physical order, confidence, title, price, location, status, or modification time.

Inline edits save to the same authoritative working batch used by Review and Publish. Dirty, saving, saved, and failed states are visible. Stale revisions are rejected instead of silently overwriting newer work.

Select rows for bulk price, discount, location, tags, rare/review flags, and approval. Large changes create rollback checkpoints.

BATCH EDITOR

Bulk operator workstation

Fix uncertainty, bulk-price inventory, and approve valid rows without leaving the keyboard.

5. CSV round trip and difference preview

Download CSV from Publish for external editing. Upload the edited CSV back to SnapIMS. The upload is staged and cannot alter the working batch until the difference preview is confirmed.

The preview summarizes matched, changed, unchanged, missing, unmatched, and invalid rows. Changed fields show current and uploaded values. Blocking errors must be resolved before application.

CSV difference preview before applying values

Applying a CSV creates a durable rollback checkpoint. Immutable Item IDs remain unchanged. Review, Batch Editor, CSV export, and Publish immediately use the applied working values.

CSV values applied to the authoritative working batch

Mark Uploaded Batch as Externally Reviewed is available only after validation succeeds and the operator explicitly accepts responsibility. Unresolved rows remain unfinished.

6. Publish and export

Publish validates the current authoritative working batch regardless of whether values came from AI, Review, Batch Editor, or CSV. Blockers link back to the item that needs correction.

Use Shopify Simulation before a live publish. Download the current CSV at any time. Live Shopify publishing remains subject to correct credentials, explicit confirmation, and production acceptance testing.

PUBLISH

Validate and publish

Publish always uses the current authoritative working batch.

9. End-of-batch checklist

- ☐ Import preview matched the physical batch.
- ☐ Recognition failures were retried, skipped, or manually reviewed.
- ☐ No required title is blank.
- ☐ Prices, discounts, quantities, locations, and SKUs validate.
- ☐ Low-confidence and flagged records were reviewed.
- ☐ CSV differences, if used, were inspected before application.
- ☐ A rollback checkpoint exists before large bulk changes.
- ☐ Publish simulation passed.
- ☐ Final CSV was downloaded and checked.
- ☐ SnapIMS was restarted once and the working batch remained intact.

Production status

Version 0.6.0 is a minor operator-workstation release. It is not SnapIMS 1.0. The real 20-tape Pixel pilot, live AI test, one live Shopify draft, physical CSV reconciliation, final restart durability test, independent guide walkthrough, and absence of production blockers remain required before 1.0.0.
