

SnapIMS Complete Operating Manual

Operations, diagnostics, recovery, and release readiness

Active release v0.13.2 · August 4, 2026

SnapIMS is local-first inventory software. This guide describes the browser interface and command behavior verified for the active release.

1. Product model

SnapIMS keeps immutable internal Batch and Item identities while allowing operator-visible batch names and locations to change. Source folders remain audit evidence and are never renamed by display-name edits.

Layer	Purpose
Source photos	Immutable operator originals
Import cache	Restart-safe dimensions, readability, QR result, thumbnail, optional hash
Inventory database	Batches, Items, history, controlled Tags, checkpoints
Recognition	Durable provider attempts/results and evidence
Review/Batch Editor	Human decisions and audited edits
Publish	CSV and guarded Shopify draft workflow

2. Performance design

- Folder list reads immediate child directories without opening every photograph.
- Preview runs as a background job and returns browser control immediately.
- Unchanged photographs are not decoded or QR-scanned again.
- Final preservation hashes are streamed at Commit and reused.
- Batch Editor and Publish use bounded database pages and aggregate summaries.
- SQLite connections close explicitly after every context.

Measured scenario	v0.13.2 sandbox result
20-item / 42-photo cold Preview	479 ms
20-item warm Preview	18 ms, 0 decodes, 0 scans
100-item / 202-photo cold Preview	2,388 ms
100-item warm Preview	40 ms
5,000-item Batch Editor	430,721 bytes; 100 rows; 0.414 s relayed Chromium render
Full suite descriptors	3 baseline; 166 peak; 7 final; 0 final SQLite

3. Complete workflow

1. Start and verify release identity.
2. Prepare one batch folder and NEXT separators.
3. Preview and correct grouping.
4. Commit immutable inventory records.
5. Run Recognition or leave provider-blocked Items for manual work.
6. Review evidence and commercial fields.
7. Use paged Batch Editor for controlled mass edits.
8. Verify CSV when used.
9. Simulate and perform guarded Publish only when ready.
10. Stop and back up.

IMPORT - FOLDER WORKFLOW

Import one folder as one batch

Folder boundaries define the batch. Photograph CVHS1:ITEM:NEXT between tapes; no other QR card controls routine Import.

BATCH HOME DIRECTORY

/tmp/snapims-v0132-browser-data/batches

Create one immediate child folder for each batch. SnapIMS never scans the rest of your operating-system home directory.

Only active command

CVHS1:ITEM:NEXT

The first product photo starts item 1, the end of the folder closes the final item.

Download NEXT ITEM card

ROLLBACK

Batch checkpoints

Batch Editor evidence from the v0.13.2 browser pass.

4. Audit and conflict rules

- Every accepted edit remains tied to the immutable Item ID.
- Location changes create location-history events.
- Bulk operations are atomic and checkpointed where required.
- Stale revisions are rejected rather than overwriting newer work.
- Duplicate Import Preview/Commit requests resolve to one durable job/result.
- A mixed application/schema version is refused before serving normal work.

5. Diagnostics

```

snapims doctor
snapims status
snapims logs

```

Status reports project path, Python executable, data directory, PID, version, and schema. External-service failures do not imply inventory database failure; read each component separately.

6. Security

- Configure authentication before public exposure.
- Keep secrets outside source control and verify owner-only secret-file permissions.
- Use CSRF-protected state changes and revoke sessions after credential changes.
- Treat Cloudflare, Guacamole, xrdp, and remote-shell exposure as separate deployment controls.

7. Production acceptance

v0.13.2 is pilot-ready, not v1.0.0. Before 1.0, complete the real 20-tape Pixel pilot, live AI, live Shopify draft, real CSV round trip, target-machine restart durability, direct Firefox/Chromium walkthrough, guide verification, security/deployment review, backup/restore drill, and zero-blocker review.

8. Skipped sandbox capabilities

Capability	Reason
Live OpenAI	No production API key
Live Shopify	No store/token
Native Firefox	Runtime unavailable
Direct localhost Chromium	Managed URLBlocklist
2012 Mac mini	Hardware unavailable
Cloudflare/Guacamole	Owner infrastructure unavailable
HEIC	pillow_heif unavailable
